

### AMENDMENTS TO THE CLAIMS

1. (Currently Amended) A receiver comprising:

a receiving section for receiving a first communication signal through a first communication system, the first communication signal including a plurality of contents with corresponding content identifiers, the first communication signal further including contents and limitation information for a particular content, wherein the limitation information differs from the content identifier corresponding to the particular content;

a transmitting and receiving section requesting a transmission of a second communication signal containing release information and receiving said second communication signal through a second communication system enabling bi-directional communications;

an operation section through which a user designates one of the content identifiers;

a matching detection section for making a judgment as to whether or not said release information matches said limitation information when the user designates the content identifier for the particular content; and

an output section configured to prevent normal outputting of at least one portion of said ~~contents-particular content~~ when a match is not detected between said release information and said limitation information, and to output said ~~contents-particular content~~ normally when a match is detected between said release information and said limitation information;

wherein said first communication signal contains transmission source information for specifying a transmission source in order to obtain said release information that matches said limitation information corresponding to said contents constituted by said first communication

signal, and

wherein said receiver receives said second communication signal automatically by obtaining said transmission source information contained in said first communication signal.

Claim 2 (Canceled)

3. (Withdrawn) The receiver according to claim 1, further comprising:

a storing section for storing said release information and discrimination information for discriminating said contents,

wherein said receiver receives said contents corresponding to said discrimination information stored in said storage section as said first communication signal, and, outputs said contents normally when said release information stored in said storage section matches said limitation information corresponding to said contents.

4. (Withdrawn) The receiver according to claim 3, further comprising an accumulation section for accumulating said first communication signal.

5. (Withdrawn) The receiver according to claim 4, wherein said storage section stores said first communication signal on condition that said contents corresponding to said discrimination information stored in said storage section as said first communication signal.

6. (Withdrawn) The receiver according to claim 5, wherein said storage section stores

said first communication signal on additional condition that said release information stored in said storage section matches said limitation information corresponding to said contents.

7. (Previously Presented) The receiver according to claim 1, wherein said limitation information is multiplexed with said contents and said transmission source information in said first communication signal.

8. (Original) The receiver according to claim 1, wherein said output section indicates that said communication is being carried out through said second communication system upon request and receipt of said second communication signal.

9. (Original) The receiver according to claim 1, wherein said contents include video data.

10. (Original) The receiver according to claim 1, wherein said contents include music data.

11. (Original) The receiver according to claim 1, wherein said contents include program data.

12. (Currently Amended) A distribution method of release information comprising:  
transmitting a communication signal through a first communication system to a receiver,  
the communication signal including a plurality of contents with corresponding content

identifiers, the communication signal further including limitation information for a particular content, wherein the limitation information differs from the content identifier of the particular content; and

distributing release information to ~~a~~the receiver, the release information matching the limitation information that is ~~supplied~~transmitted along with the plurality of contents to the receiver through ~~a~~the first communication system,

wherein said release information is distributed to the receiver through a second communication system enabling bi-directional communications,

wherein the communication signal transmitted through the first communication system further includes a transmission source information for specifying a transmission source of said release information ~~is supplied together with said contents and limitation information to the receiver,~~

wherein the distributing step is performed in response to the receiver establishing bi-directional communications with the transmission source through the second communication system based on the transmission source information, and requesting the release information from the transmission source via the established bi-directional communications, and

wherein, in response to a user of the receiver designating the content identifier of the particular content, the receiver is configured to prevent normal outputting of at least one portion of the contents-particular content until the receiver detects a match between the release information and the limitation information.

13. (Canceled)

14. (Currently Amended) A ~~distribution~~ method of distributing a plurality of contents, comprising:

establishing communications with a receiver through a first communication system; and  
distributing ~~which distributes~~ said plurality of contents along with corresponding content  
identifiers through a ~~the~~ first communication system to a ~~the~~ receiver, wherein said plurality of  
contents are supplied together with limitation information for a particular content and  
transmission source information for specifying a transmission source for a second  
communication system that enables bi-directional communications and with limitation  
information,

wherein the receiver is configured to use the transmission source information to establish  
bi-directional communications with the transmission source via the second communication  
system, and request release information from the transmission source via the established bi-  
directional communications.

and wherein, in response to a user of the receiver designating the content identifier of the  
particular content, the receiver is configured to prevent normal outputting of ~~said contents~~ the  
particular content until the receiver detects that the release information, which is obtained from  
said transmission source through the second communication system, matches the limitation  
information.

15. (Previously Presented) The distribution method of contents according to claim 14, wherein said contents are multiplexed with said limitation information and said transmission source information.
